---------------------------	--------------------------------	--

PENERANGAN/INFORMATION:

1.0 Awareness Programme Objectives

In the workplace, health, safety and environment (HSE) awareness is all about understanding the need to prevent avoidable accidents from occurring, health risks to workers and also massive environmental effects. There are three compelling reason why every organisations and individuals must accept HSE impact as vital elements of all activities in the workplace which are the humanity, economic and legal. Therefore, it is a responsibility of the employers to establish a well-planned HSE awareness program for all workers as they:

- can have potential impacts on the safety, health and environment aspect; and
- can have good ideas about how to improve safety, health and environmental management effort by employers.

This HSE awareness programmes to be designed and conducted in order to:

- establish and implement an occupational safety and health, and environmental program that can
 - prevent workers injuries, illnesses and fatalities
 - protect the environment through the ongoing planning, implementation, integration and management control of these programs
 - reduce number of accident
- provide every workers with the opportunities to acquire knowledge, attitude, value, commitment and skills needed to protect and improve the workplace condition and environment. In other words, encourage their participation in improving and safeguarding not only themselves but the environment;
- create new behaviours in workers and employers towards HSE; and
- ensure workers are capable of carrying out their responsibilities at workplace. Skills and knowledge on identifying and solving issues regarding work and tasks, which can leads to workplace and environmental problems, must be gain and practiced throughout work.

Every party is involved and plays a huge role in ensuring a planned HSE awareness programme been under take successfully. By implementing required elements in the awareness programs, all undesirable losses can be minimized by making workplace safer to workers and also to the environment. In other words, this programme can helps

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 3 Drpd / of: 17
---------------------------	--------------------------------	--

employers in terms of;

- improving production / productivity.
- reducing production cost.
- reducing damage to plant, machinery and environment.
- preventing premature death of skilled workers (loss to the society).
- avoiding needless pain and suffering to the employees and their families.

As for the workers, it enable workers to:

- recognize unsafe practices and conditions. It requires following of safety, health and environment procedures.
- get to know all about the conditions that promote health, safety and environment at the workplace.
- be willingness to take time to prevent accident.
- have the right attitude about health, safety and environment, both for their own and their co-worker's.
- prevent injury, illness and accidental damage to company property.
- increased workers morale, satisfaction and motivation
- improved alertness and concentration among workers

2.0 Planning Awareness Programmes

There are standards that require program activities to be identified and made to tailor the different needs of various levels or functions in the organisation, and for those whose work may lead to a significant effect to safety and health and also impact on the environment, to receive appropriate information regarding hazards, risks and its control measures. These require workers at all levels to be made aware of:

- importance of maintaining compliance with the safety, health and environmental policy and objectives, and the requirements of the management system established under standards;
- how their roles and responsibilities can help to achieve and maintain compliance the potential safety, health and environmental aspects of their work activities;
- workplace and environmental benefits of improved performance; and
- cost benefits of measures to improve workplace and environmental performance.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 4 Drpd / of: 17
---------------------------	--------------------------------	--

Good planning is fundamental to the success of a HSE awareness programme. The main points to consider are:

i) Support and resources

The overall success of the initiative depends on the cooperation, acceptance and involvement of everyone in the organizations. Early and ongoing support from senior management is key to the success of the programme. Support from top and senior management is critical and should be visible to all staff in the organisation. Communication from senior management promoting the program is one way of demonstrating commitment.

An 'energy team' to help run the initiative which includes representatives from all parts of the organisation can be set up as resources. Team should include representatives from groups such as:

- management (if organizations is a large facility, include a senior executive, department head or a supervisor)
- union representatives or job steward (if organization is unionized)
- engineering or operations
- accounting or finance
- cleaning, housekeeping and maintenance
- personnel from public relations, marketing or special events planning
- human resources

As team members are chosen from various areas and functions within organization, identifying roles and assigning tasks will come naturally. A good system in place, which include internal mail, intranets or standard communication from human resources can be utilised to disseminate information within the organisation.

Budget is also a major requirement and need to be proper plan and realistic, required for producing and distributing promotional materials, and for incentives such as competition prizes. Find a way to keep costs down by using internal resources and supporting material. Other than that, sufficient time to carry out the programme effectively must be allowed.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 5 Drpd / of: 17
---------------------------	--------------------------------	--

ii) Know current situation

To select or decide any HSE awareness programme to be conducted, designated team or personnel must be assessed:

- current HSE situation at the workplace in terms of compliance to law and procedures; accident, dangerous occurrence and health illness statistics;
- current awareness level among workers regarding issues related to HSE at workplace; and
- Categories of workers which the HSE issues has been determined and identified as a problem.

Using input from workers to design the program is important for several reasons. First, it ensures that the program's content, themes, activities, and communication channels are valid and appropriate for the target audience. The second reason to involve workers is that more involvement up front will encourage buy-in and participation as the program gets underway.

iii) Target audience profile and goals

It is important to confirm who the target audience is for intended program because message and delivery mechanisms will differ according to intended audience. Clearly defining audiences will allow development of effective messages, activities and plans that will address the needs of each group. Through the survey and interview conducted, primary audience who represents the people most target for the awareness programme can be determined, most likely they includes the workers. Secondary audiences are groups who may have an interest, although they are not directly affected. They include suppliers, customers, contractors and visitors. Some may be willing to adjust their behaviour in order to support organizations' vision.

Determination of awareness programme topics and agenda can be established from gathered information derived from organizations' workplace HSE performance and legislation compliance report and statistics. Current trends of workplace accidents and dangerous occurrences, and reported health illnesses can be used in determining types of awareness programme that can be prioritized. Other than that, input gathered from target audience as below can be used as outlining the awareness programme:

- Topics they already know.
- Areas where they might need extra instruction.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 6 Drpd / of: 17
--------------------	-------------------------	--

- suitability and efficiency of previous training, whether it worked or not

Understanding of audience behaviour and acceptance is very important in determining the awareness programme topics. For that, following principles of learning can be applied:

- People learn best when they are ready to learn.* Therefore, time spent motivating employees so that they want to learn about safety, health and environment is time well spent. The reason for workers to learn and how they will benefit personally from having done so need to be explained.
- People learn more easily when what they are learning can be related to something they already know.*
- People learn best in step by step manner.* Learning should be organized into logically sequence steps that proceed from the concrete to the abstract, from simple to complex, and from known to unknown.
- People learn by doing.* Explanation can be part of the teaching process but are only useful if they are followed by application activities that require the learner to demonstrate or do something.
- The more often people use what they are learning, the more they will remember and understand it.*

iv. Communication plan

Communication is vital in ensuring successful of intended awareness programme. There are many resources that can be considered to support and enhance communication efforts. Right language for the target audience must be used. Keep it simple and appropriate, easy to understand and remember, consistent and relevant, focused on one idea and repeated frequently.

Select the right communication channels. Once target audience and the appropriate messages identified, way to convey them can be work out. Use an assortment of methods as people respond differently to each medium. Some will respond to pictorial messages, others to written messages and others will listen to verbal communications. There are a number of routes to choose from depending on your audience and the particular message. Select communications tools that will deliver message in the most effective way. Following suggestions can be consider:

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 7 Drpd / of: 17
---------------------------	--------------------------------	--

- printed materials such as newsletters, memos, pamphlet/brochures, bulletins, posters, press releases
- internet-based products such as e-newsletter, email, blog, social medias such as Face book and Twitter
 - public channels such as displays and booths, committees, bulletin boards
 - promotional items such as T-shirts, stickers, hats

v. Recognize and reward

Activities such as competitions, challenges and contests combined with awards programs can encourage and motivate staff to participate in your program. Awards programs help build momentum, generate interest and motivate behavioural change. Awards can be given as prizes for contests, incentive for participating in activities or to recognize significant contributions. Support from local sponsors can be solicited to obtain awards. Awards can range from small items.

3.0 Implement and Monitoring an Awareness Programmes

Detailed schedule for the timing and delivery of an awareness programmes must be developed. Timing is important. Build interest by putting on a day or week long event or by organizing numerous activities over the course of a year. The longer the awareness programme runs, the better embedded the message will become in people's minds.

3.1 Awareness Programme Activities

It is a good idea to explain the implications for the organisation if procedures are not followed. Education, including formal education, public awareness and training should be recognized as a process by which human beings and societies can reach their fullest potential. Awareness program to workers including management staffs should be regular and ongoing and not a one-off event. It should be a part of the mainstream daily management of business and should include staff at all levels, including senior management.

(i) Workers training

An effective training program can reduce the number of injuries and deaths, property damage, legal liability, illnesses, workers' compensation claims, and missed time from work. It also helps establish a safety culture in which employees themselves help promote proper safety procedures while on the job. It is important that new employees

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 8 Drpd / of: 17
---------------------------	--------------------------------	--

be properly trained and embraces the importance of safe and healthy workplace, as it is easy for seasoned workers to negatively influence the new hires.

(a) Workers' initial awareness training

Health, safety and environment education should start with employee orientation when an employee joins the organization or is transferred to a new job. Orientation sessions normally cover such items as explanation of the function of the work unit, organizational relationships, administrative arrangements, and miscellaneous policies and rules.

During this first training session, workers will be equipped with basic awareness knowledge that:

- introduces the organisation's safety, health and environmental policy
- explain why safety, health and environmental management is being adopted;
- highlights the organisation's commitment to safety, health and environmental management and improvement;
- described what the organisation's hope to achieve form implementing a good safety, health and environmental management system;
- discuss the safety, health and environmental impacts of their activities;
- explain any new or modified procedures related to work; and
- Explain how it relates to individual worker (e.g. working at heights, handling chemicals at laboratory, taking measurements, recording waste arising, and segregating wastes, sweeping up solid waste and switching off hoses when not in use).

(b) Workers' refresher/normal training

Workers should receive training to make them aware of their own responsibilities relating to safety, health and environmental protection. Individuals who are expected to manage particular elements of a safety, health and environmental management system and explain them to others need a greater level of training.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 9 Drpd / of: 17
--------------------	-------------------------	--

This could include:

- more detailed information about specific elements of the safety, health and environmental management system and other concerns related to specific safety, health and environmental issues;
- an introduction to the safety, health and environmental legislation governing the issues they are required to manage;
- An introduction to safety, health and environmental management system documentation and procedures.
- Understand the potential consequences of not following safety, health and environmental management system requirements (such as spill, releases, fines or other penalties).

(ii) Contractors' awareness program

Contractors and suppliers form part of organisation's safety, health and environmental management system, make them aware of their relationship to the management system. Depending on their duties on workplace, a higher degree of awareness may be necessary through specific contractor training. During the contractor awareness program, activities such as below can be including:

- issuance of a copy of the safety, health and environmental policy;
- short introduction to workers on safe working procedures and requirements; and
- Presentation highlighting the environmental issues related to workplace.

To prove that contractors have received the correct training, an acknowledgement form stated that they have received the information (as they do after a health and safety briefing) must be signed, for example attendance list. This can help organisation in seeking external certification/registration.

(iii) Awareness Campaign

A safety, health and environment awareness campaign could be carried out to enforce the idea of safe, healthy and environment friendly as a way of life for all major stakeholders including employers, workers and safety representative. A campaign could be carried out by way of using mass communication such as using posters, banners and incentives for having a safe work place or zero incidents incentives.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 10 Drpd / of: 17
---------------------------	--------------------------------	---

The main objective of the campaign is to drill into the mind of stakeholders that 'Safety, Health and Environment Comes First' above all others, even bottom lines of the organization. Top management must take the initiative to realize this vision and it is immortalized in the organization's Safety Policy.

Objective of conducting awareness campaign is to promote broad awareness to strengthen attitudes, values and actions of the workers that are compatible with sustainable development. A successful safety, health and environmental behaviour change programme can:

- improve stakeholder communication and involvement in establishing a conducive workplace environment;
- improve workers morale, motivation and retention rates;
- compliance with related legislation;
- increase competitiveness;
- improve protection from increasing resource scarcity (energy or raw materials) and rising costs;
- reduce operational costs (lower waste, energy and transport costs);
- increase profitability and enhance business reputation; and
- Attainment of Corporate Social Responsibility (CSR) goals.

It is also good to get an involvement of the respective Government agencies that involved with the enforcement of the environment legislation.

4.0 Awareness Program Monitoring and Evaluation

Awareness program evaluation is a systematic method for collecting, analyzing, and using information to answer questions about programs, particularly about their effectiveness and efficiency. In both the public and private sectors, stakeholders often want to know whether the programs they are funding, implementing, voting for, receiving or objecting to be producing the intended effect, Evaluation of awareness programmers is:

- To gain information on how to improve future awareness programs.
- to justify the existence and budget of the training department by showing how it contributes to the organization's objectives and goals; and
- To decide whether to continue or discontinue training programs.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 11 Drpd / of: 17
---------------------------	--------------------------------	---

Following is the kinds of assessment, which may be appropriate at these different stages:

- i) assessment of the need for the program
- ii) assessment of program design
- iii) assessment of how the program is being implemented
- iv) assessment of the program's outcome or impact
- v) assessment of the program's cost and efficiency

The methods used for each type of evaluation will vary. Both qualitative and quantitative methods can be used within the design of an evaluation

i) Assessing needs

A needs assessment examines the population that the program intends to target, to see whether the need as conceptualized in the program actually exists in the population; whether it is, in fact, a problem; and if so, how it might best be dealt with. This includes identifying and diagnosing the actual problem the program is trying to address, who or what is affected by the problem, how widespread the problem is, and what are the measurable effects that are caused by the problem.

Needs assessment involves the processes or methods to describe and diagnose social needs. Needs assessment involves research and regular consultation with community stakeholders and with the people that will benefit from the programmed before the programmed can be developed and implemented. In this way potential problems can be realized early because the process would have involved the community in identifying the need and thereby allowed the opportunity to identify potential barriers.

There are four steps in conducting a needs assessment:

1. Perform a 'gap' analyses.

Evaluators need to compare current situation to the desired or necessary situation. The difference or the gap between the two situations will help identify the need, purpose and aims of the program.

2. Identify priorities and importance.

Evaluators would have identified a number of interventions that could potentially address the need e.g. training and development, organization development etc. These must now be examined in view of their significance to the program's goals and constraints. This must be done by considering the following factors:

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 12 Drpd / of: 17
--------------------	-------------------------	---

- ✓ cost effectiveness (consider the budget of the program, assess cost/benefit ratio);
 - ✓ executive pressure (whether top management expects a solution); and
 - ✓ Population (whether many key people are involved).
3. Identify causes of performance problems and/or opportunities and to also assess the skills of the people that will be carrying out the interventions.
 4. Identify possible solutions and growth opportunities Compare the consequences of the interventions if it was to be implemented or not.

Needs analysis is hence a very crucial step in evaluating programs because the effectiveness of a program cannot be assessed unless we know what the problem was in the first place.

ii) Assessing programmed theory

The programmed theory, also called a logic model or impact pathway, is an assumption, implicit in the way the programmed is designed, about how the programmer's actions are supposed to achieve the outcomes it intends. This 'logic model' is often not stated explicitly by people who run programs, it is simply assumed, and so an evaluator will need to draw out from the program staff how exactly the program is supposed to achieve its aims and assess whether this logic is plausible.

This is why it is important to read research that has been done in the area. Explicating this logic can also reveal unintended or unforeseen consequences of a program, both positive and negative. The program theory drives the hypotheses to test for impact evaluation. Developing a logic model can also build common understanding amongst program staff and stakeholders about what the program is actually supposed to do and how it is supposed to do it, which is often lacking. Of course, it is also possible that during the process of trying to elicit the logic model behind a program the evaluators may discover that such a model is either incompletely developed, internally contradictory, or (in worst cases) essentially non-existent. This decidedly limits the effectiveness of the evaluation, although it does not necessarily reduce or eliminate the program.

Creating a logic model is a wonderful way to help visualize important aspects of programs, especially when preparing for an evaluation. An evaluator should create a logic model with input from many different stakeholders. Logic Models have 5 major components: *Resources or Inputs, Activities, Outputs, Short-term outcomes, and Long-term outcomes.*

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 13 Drpd / of: 17
---------------------------	--------------------------------	---

Creating a logic model helps articulate the problem, the resources and capacity that are currently being used to address the problem, and the measurable outcomes from the program. Looking at the different components of a program in relation to the overall short-term and long-term goals allows for illumination of potential misalignments. Creating an actual logic model is particularly important because it helps clarify for all stakeholders: the definition of the problem, the overarching goals, and the capacity and outputs of the program. Suggested four approaches and procedures that can be used to assess the program theory are as below:

1. Assessment in relation to social needs.

This entails assessing the program theory by relating it to the needs of the target population the program is intended to serve. If the program theory fails to address the needs of the target population it will be rendered ineffective even when if it is well implemented.

2. Assessment of logic and plausibility.

This form of assessment involves asking a panel of expert reviewers to critically review the logic and plausibility of the assumptions and expectations inherent in the program's design. The review process is unstructured and open ended so as to address certain issues on the program design. Questions listed below is suggested to assist with the review process:

Are the program goals and objectives well defined?

Are the program goals and objectives feasible?

Is the change process presumed in the program theory feasible?

Are the procedures for identifying members of the target population, delivering service to them, and sustaining that service through completion well defined and sufficient?

Are the constituent components, activities, and functions of the program well defined and sufficient?

Are the resources allocated to the program and its various activities adequate?

3. Assessment through comparison with research and practice.

This form of assessment requires gaining information from research literature and existing practices to assess various components of the program theory. The evaluator can assess whether the program theory is congruent with research evidence and practical experiences of programs with similar concepts.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 14 Drpd / of: 17
---------------------------	--------------------------------	---

4. Assessment via preliminary observation.

This approach involves incorporating firsthand observations into the assessment process as it provides a reality check on the concordance between the program theory and the program itself. The observations can focus on the attainability of the outcomes, circumstances of the target population, and the plausibility of the program activities and the supporting resources.

These different forms of assessment of program theory can be conducted to ensure that the program theory is sound.

iii) Assessing implementation

Process analysis looks beyond the theory of what the program is supposed to do and instead evaluates how the program is being implemented. This evaluation determines whether the components identified as critical to the success of the program are being implemented. The evaluation determines whether target populations are being reached, people are receiving the intended services, staff are adequately qualified. Process evaluation is an ongoing process in which repeated measures may be used to evaluate whether the program is being implemented effectively. This problem is particularly critical because many innovations, particularly in areas like education and public policy, consist of fairly complex chains of action. Many of which these elements rely on the prior correct implementation of other elements, and will fail if the prior implementation was not done correctly. Since incorrect or ineffective implementation will produce the same kind of neutral or negative results that would be produced by correct implementation of a poor innovation, it is essential that evaluation research assess the implementation process itself. Otherwise, a good innovative idea may be mistakenly characterized as ineffective, where in fact it simply had never been implemented as designed.

iv) Assessing the impact (effectiveness)

The impact evaluation determines the causal effects of the program. This involves trying to measure if the program has achieved its intended outcomes, i.e. program outcomes.

a) Program Outcomes

An outcome is the state of the target population or the social conditions that a program is expected to have changed. Program outcomes are the observed characteristics of the target population or social conditions, not of the program.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 15 Drpd / of: 17
---------------------------	--------------------------------	---

Thus the concept of an outcome does not necessarily mean that the program targets have actually changed or that the program has caused them to change in any way. There are two kinds of outcomes, namely outcome level and outcome change, also associated with program effect.

- **Outcome level** refers to the status of an outcome at some point in time.
- **Outcome change** refers to the difference between outcome levels at different points in time.
- **Program effect** refers to that portion of an outcome change that can be attributed uniquely to a program as opposed to the influence of some other factor.

b) Measuring Program Outcomes

Outcome measurement is a matter of representing the circumstances defined as the outcome by means of observable indicators that vary systematically with changes or differences in those circumstances. Outcome measurement is a systematic way to assess the extent to which a program has achieved its intended outcomes. Measuring the impact of a program means demonstrating or estimating the accumulated differentiated proximate and emergent effect, some of which might be unintended and therefore unforeseen.

Outcome measurement serves to help you understand whether the program is effective or not. It further helps you to clarify your understanding of your program. But the most important reason for undertaking the effort is to understand the impacts of your work on the people you serve. With the information you collect, you can determine which activities to continue and build upon, and which you need to change in order to improve the effectiveness of the program.

This can involve using sophisticated statistical techniques in order to measure the effect of the program and to find causal relationship between the program and the various outcomes.

v) Assessing efficiency

Finally, cost-benefit or cost-effectiveness analysis assesses the efficiency of a program. Evaluators outline the benefits and cost of the program for comparison. An efficient program has a lower cost-benefit ratio.

NO. KOD / CODE NO.	Z-009-4:2015-M02/P(1/3)	Muka Surat / Page : 16 Drpd / of: 17
---------------------------	--------------------------------	---

Once an evaluation is complete it is important to provide feedback to the stakeholders involved in the programme. Dissemination of the results will help garner further support for the programme if it is successful, and help others gain support for the introduction of similar programmes. Publicity from dissemination activities may also increase the impact of the programme. If the programme has not been successful it is important to share this with others so that weaknesses or relevant issues are considered in other similar interventions, including whether or not to introduce such interventions. Dissemination may involve presenting the results at public meetings, using the media to publicise the outcomes of the programme, or publishing reports and papers in the scientific literature.

Implementation of any requirements, tasks or outcome from the awareness programs activities should be monitored and assessed. Administrative data can be used to evaluate and monitor awareness program activities successes, such as:

- rate of absenteeism among workers
- workplace accident/incident rates and health illnesses reports
- return to work rate from injuries or illnesses
- number of workers promotions/year
- rate of organizations' turnover
- cost of group insurance (prescription drugs, dental, etc.)
- number of events or activities held last year
- changing behavior or attitudes towards more healthy habits

---------------------------	--------------------------------	---

SOALAN/QUESTION :

1. What is the significant of establishing a well-planned HSE awareness program for all workers?
2. Name 5 main points to consider when planning an awareness programme.
3. How collections of information required as the parameters of selecting suitable awareness programme can be gathered?
4. What programme evaluation method can be conducted during a program's lifetime?
5. Why evaluations of the environmental awareness program need to be done?
